

FixLicTool

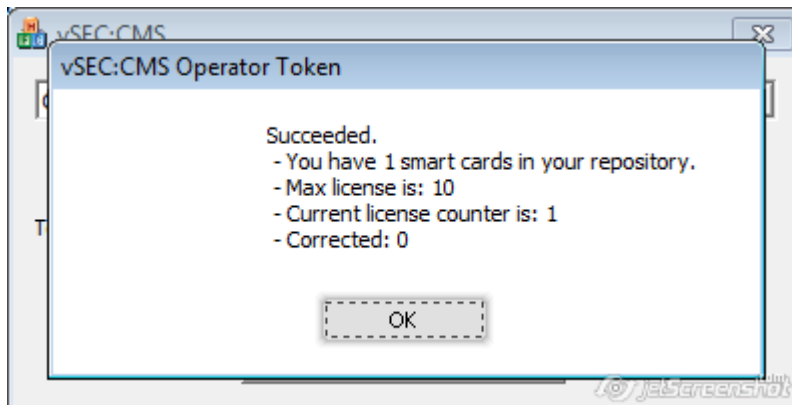

This tool fixes license counter issues in operator applet on vSEC:CMS S-Series operator tokens.

How to use it

- Copy the file 'FixLicTool_S.exe' to CMS server
- Make sure that the CMS admin console is not open on the server
- Start the tool (FixLicTool_S.exe)

- Select the correct reader (the one from the Operator Token), or make sure there is no other smart card available on the system, so the correct reader gets automatically selected.
- Enter Token owner PIN and click "Correct" button.
- If it was successful, you get this message:

It says how many cards are in the repository and which license counters are currently in the applet.
